GEPON ONU SFF 2X10
GEUF-3411P-E2CDB

Features

- Single fiber Bi-Directional transceiver with single SC/PC pigtail
- 1310nm burst-mode 1.25Gbps transmitter with DFB LD laser
- 1490nm continuous-mode 1.25Gbps receiver with APD-TIA
- Burst mode:"low" active
- Complies with IEEE Std 802.3ah™ -2004
- Digital diagnostic interface compliant with SFF-8472 Rev 9.5 , Digital Diagnostic Monitoring (DDM) with external calibration
- 3.3V Single power supply
- Complies with RoHS directive (2002/95/EC)
- Operating case temperature:Standard : 0 to +70°C

Applications

- IEEE 802.3ah 1000BASE-PX20++
- GE-PON ONU
- Burst mode application.
- FTTx WDM Broadband Access

Description

The GEUF-3411P-E2CDB Bi-Directional Transceiver is the high performance module for single fiber communications by using 1310nm 1.25Gbps burst mode transmitter and 1490nm 1.25Gbps continuous receiver. It is Optical Network Unit (ONU) for IEEE Std 802.3ah™ -2004. The optical transceiver is compliant with Multi-Source Agreement (MSA) Small Form Factor (SFF) 2x10 footprint.

The transmitter section uses a 1310nm DFB laser diode with automatic power control (APC) function and temperature compensation circuitry to ensure stable extinction ratio over all operating temperature range, and full IEC825 and CDRH class 1 eye safety. The receiver has a hermetically packaged PIN-TIA (trans-impedance amplifier) pre-amplifier and a limiting amplifier with CML compatible differential outputs.

Digital Diagnostic Memory Map

The transceivers provide serial ID memory contents and diagnostic information about the present operating conditions by the 2-wire serial interface (SCL, SDA).

The diagnostic information with internal calibration or external calibration all are implemented, including received power monitoring, transmitted power monitoring, bias current monitoring, supply voltage monitoring and temperature monitoring.

The digital diagnostic memory map specific data field defines as following.

Notes:

Plug Seq.: Pin engagement sequence during hot plugging.

1) Logic 0 indicates loss of signal; Logic 1 indicates normal operation. In the low state, the output will be pulled to less than 0.8V.
2) RD-/+: These are the differential receiver outputs. They are internally AC-coupled 100 differential lines which should be terminated with 100Ω (differential) at the user SERDES.
3) BURST is a TTL input. When it is low, LD is on; when it is high, LD is off.
4) TD-/+: These are the differential transmitter inputs. They are internally AC-coupled, differential lines with 100Ω differential termination inside the module。
5) SCL,SDA should be pulled up with a 4.7k~10kΩ resistor on the host board. The pull-up voltage shall be VccT or VccR.
   SCL is the clock line of two wire serial interface for serial ID
   SDA is the data line of two wire serial interface for serial ID
